

1 Agreement is not terminality

Probes agree while the answer is still moving.

2 So we searched the whole rule space

3,520 rules

window size × share threshold,
× schedule / maturity / validity

Can any consensus rule be safe and saving?

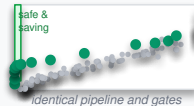

3 Not one clears a preregistered gate

0 / 3,520

Safe forces zero saving;
saving forces a real loss.

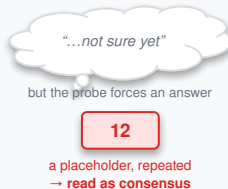

4 A non-consensus signal clears them

DEER 3 / 3
-0.3 pp @ 28% saved

The failure is the signal,
not early exit.

5 Why the signal fails

Forced probing masks the model's true estimate.

Early exit is possible — the consensus **signal** is what cannot make it safe.
